

Release Notes

MedCen 6.2 Build 28

Referral Writer

When the updated referral writer was first released the installation code contained a flaw which prevented the required support libraries from being properly installed. This has been resolved.

The [Blank Plain Text] and Standard.rtf templates in the updated referral writer have been updated to include the basic patient information which was in the existing referral writer.

One practice has reported rich text letters printing in landscape rather than portrait orientation. We believe that this is due to the different printing system used to print rich text, and the particular model of printer. This issue is still being investigated.

If you encounter this issue, consider picking the [Blank Plain Text] option from the templates list on the referral writer when you start a letter. Plain text letters will print using the normal letter header and printing system.

Care Plus Electronic Messaging

An issue was resolved which prevented Care Plus reviews from being correctly matched against the appropriate enrolment.

Preparing Remote Laptop Data

The database structure update released with the last update was not being picked up correctly by laptops when preparing remote data. This issue has been resolved.
